Groundnut: Preventing Aflatoxin

Aflatoxin management

First, plant at proper density, harvest crop promptly and dry crops properly by turning them over in field for a few days and after, pluck seed pods and dry them further on tarpauline. Sort out the damaged nuts and store nuts in shell and clean dry bags away from pests and never allow to get wet again.
Finally, when shelled, sort nuts again and never to feed people or livestock on infected nuts.
