

Herbal pest repellent (summary)

Making repellent

As a way to make herbal pest repellents, plant plenty of flowering plants in and around field to attract pollinators and equally grow plants that repel insects in the rows of the crop. Prepare herbal repellent from wild trees and plants and put 5kg of chopped plant leaves in plastic containers and add 10l of water.

Similarly, add 1l of cow urine to extract repelling components and put containers in shade and stir daily for a week. Prepare second type of insect repellent with ginger, garlic and chillies and boil them in 5l of water and after cooling down, mix with 1l of cow urine and ferment.

Finally, repellent is used to control pest in any crops.
