»How to grow passion fruit from cuttings- Water vs Seed Raising Mix«

Being a highly nutritious fruit rich in vitamins, simple technologies can be used to produce seedlings for improved production.

Growing of passion fruits from cuttings is a technology which is highly used to produce high yielding clones and it is done by cutting stem first below first node and then above the second node for perfect production.

Fruit cuttings

First remove the leaves from the cutting to reduce water stress upon growing and place them into a rooting hormone to increase the ability of the cutting to develop roots easily and place in the medium for germination.

Similarly, place remaining cuttings in water for water cutting and stabilize cutting by pushing soil around base of cuttings. Finally after 8 weeks, germination will have taken place.
