

How to make organic fertilizer for all types of gardening plants

To make the fertilizer, you need to collect cow dung compost, neem cake dust, cow urine, and jaggery. Cow dung has Nitrogen, phosphorous, and potassium, and neem cake dust has Nitrogen, phosphorous, sulfur, and calcium, and is a pest-repellant. All the above produce essential microbes and jaggery is the natural food for the microbes.

Fertilizer making process

Collect 15 liters of water, 500g of cow dung compost, 200g of neem cake dust, 500 ml of cow urine, and 150g of jaggery.

Mix all the contents in a container and stir both clockwise and anti-clockwise twice every day.

Cover the container and keep it for 7 days.

After 7 days, filter the liquid and dilute the liquid by adding 1 liter of liquid per 5 liters of water and mix.

Pour the diluted fertilizer on the root zone of plants and for better results, always apply the fertilizer in the evenings.

Apply the fertilizer once every month for proper growth of plants.
