How to Start a Business- Plum Farming

Crop management

First, plant need pH 5.5-6.5 and its growth require low and mid regions. Cool winters and warm summers are best for plum farming and a farmer should plough 3-4 times land ti fine tilth stage before planting and also should add organic matter content in land and use high yielding quality seedlings.
Similarly, plantlets are planted in main field after scions is grown in a year in winter season and a farmer should plant at 6X6M and plant trees are hardy requiring less caring and management. Prune trees in january and add fertilizer according to soil and apply regular irrigation and consult to expert to control pests and diseases.
Furthermore, time to mature depend on variety howver they ripen on tree and finally harvest ripe plants and pack with proper care.
