

Making a powerful organic pesticide for plants

To make this pesticide, you would need 50g of each of garlic, ginger, and chili pepper. To make the pesticide, remove peels from garlic and ginger and paste the ingredients either using a blender or a motor and pestle.

Other steps

After blending, add 1 liter of water to the mixture and mix well with a stick or spoon. Cover the mixture and leave it for 12 hours in a shade.

After 12 hours, mix the liquid and filter and use the waste part (residue) to make compost. Add 1 liter of water into the liquid and use it on the plants.

But there is no need to add water if your plant is attacked by many insects pests.

Put the liquid in a spray bottle and spray it on your crops. This protects your crop from pests such as aphids, mites, mealy bugs, and others.

The pesticide should be used in the morning or evening and remember to wash your hands after using the pesticide to prevent it from irritating your eyes.
