

Making natural pesticide within 30 minutes using aloe Vera

The juice from aloe vera is healthy and can also be used to make ointments. Aloe vera can be used to make fungicides and pesticides for gardening. Aloe vera contains salicylic acid, potassium silicate, and other chemicals which are natural pesticides and insecticides.

Aloe vera pesticide

This can be sprayed on gardening plants to protect them from aphids, mites, sap-sucking insects, and fungus. Aloe vera juice also has a variety of anti-fungal and anti-bacterial properties.

Making organic pesticide

First, collect aloe vera leaves from our garden. The leaves are then cut into small pieces with a knife and the pieces are put in a bowl.

Water is added to the bowl and stirred with a stick.

The mixture is then kept in the shade for 30 minutes and after the 30 minutes, it is stirred again using a stick

Filter the mixture to obtain the liquid. The residue can be used to make compost and the liquid is diluted using water.

The diluted liquid is poured into a spray bottle and sprayed onto the garden plants to protect them from pests and fungi.

The liquid is used twice a month for best results and is used only early mornings and after sunset.

The liquid if used less or more concentrated has no effect on the plants.
