

# **Organic secret to healthier chickens and low feed cost**

## **Fermented feeds benefits**

First, fermentation produces good bacteria, and probiotics, boosts yields, and removes toxic chemicals from feeds. Furthermore, fermentation avails more nutrients to birds, balances the digestive system acidity and boosts the growth rate. Additionally, fermentation kills harmful bacteria, and increases the egg weight.

## **Fermentation precautions**

Do not ferment all feeds and use non chlorinated water so as to preserve good bacteria. Also ferment feeds in batches to avoid the growth of molds and wash feeders daily to prevent the risk of mold formation. Additionally, avoid using metallic feeders to avoid poisoning and water fermenting feeds where necessary. Always, monitor to observe bubbles since the appearance of bubbles is a clear indication that fermentation is taking place.
