

Silvopasture system

Being a profitable form of farming, the quality and quantity of agroforestry products highly depend on the production technology.

Being a combination of trees and livestock where both benefit from each other and produce own products, the system is divided according to ways trees are planted and each system is suitable for different types of livestock and trees.

System management

First, boundary system reduce strong wind, make boundary of land and trees have a lot of space when livestock is a supplement in a regularly spaced tree system. The system is used in small farms or homes of gardens.

Similarly, the woodland grazing system is for large forests and high diversity of livestock. Finally, tree provide ecological, economic and longterm benefits however trees also need additional costs and management.
