»Spring Garlic Maintenance Tips«

Being a highly nutritious crop rich in vitamins and other minerals, garlic growing is based on the simple technologies for massive production.

First, when planted garlic germinates, the size of the bulb is affected by the health of the plant which is determined by the improper application of the agronomic practices and natural conditions or abiotic factors.

Crop management

When planting garlic space at 4*4 inches to reduce crop competition for sunlight, nutrients and mulch to refresh the garden and water as well. Weed the garden as early as possible and apply fertilizers at 2-3 weeks after planting when garlic is 4 inches and apply after every 2-3 weeks during growing cycle.

Being a heavy feeder, garlic develops long roots with tough long surface are leaves hence apply a slow nutrient release fertilizer and finally use green grass as mulches.
