»Tilapia fish farming«

Tilapia fish grows and survives in fresh water bodies. Tilapia fish is medicinal as it contains lots of healthy nutrients. Additionally, tilapia farming is highly profitable since the fish is highly demanded as it is tasty, highly nutritious and can be easily raised by farmers. Tilapia farming is globally practised by many people to help satisfy the high global demand. Usually Tilapia fish takes 240 days to mature and has high market throughout the year.

Fishing precautions

Always ensure to properly feed tilapia fish in order to attain steadily high results and to facilitate generation of high profits. Additionally, ensure proper fish stocking in water to facilitate proper growth. Furthermore, test fish pond before starting by completely drying the pond and make water to run through for 1 month before stocking.

Also remove all old fish, water from water by repeated netting before introducing new fish species in water and thereafter dry the pond for 1 week or more under sunlight.

Harvesting and marketing

When harvesting always harvest depending on the prevailing market needs to satisfy the needs of customers and also to generate high profits. Lastly, market fresh fish as soon as possible after harvesting, properly process, pack and store fish in good environments to avoid contamination and maintain good quality.
