What it takes to farm peanuts

Peanut growing

First, plant peanut at 2 inches depth when soil misture is 70 degrees or above and ground is well levelled. As a mature peanut has dark brown colour of pods, it determines the price of peanuts.
Similarly, a machine is used to dig peanuts out of the ground allowing them to dry and harvesting machine is used after 4 days to pick peanuts. They are dried down to 10% moisture content level and pea nuts are graded by a shelling plant.
Finally, products include peanut butter, sorted nuts and oil.
